What is Virtualization

- Virtualization abstracts the underlying physical structure of various technologies. Virtualization, in computing, is the creation of a virtual (rather than actual) version of something, such as a hardware platform, operating system, a storage device or network resources[1]
- Server virtualization[2]
 - Creates multiple isolated environments
 - Allows multiple OS's and workloads to run on the same physical hardware
 - Solves the problem of tight coupling between OS's and hardware

You Know Virtualization Is Real When It Makes It To Dilbert

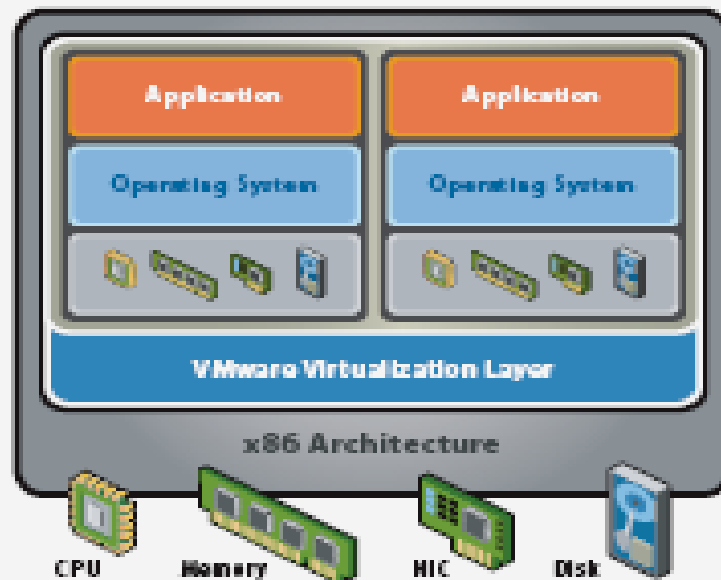

The Traditional Server Concept

Before Virtualization:

- Single OS image per machine
- Software and hardware tightly coupled
- Running multiple applications on same machine often creates conflict
- Underutilized resources
- Inflexible and costly infrastructure

The Virtual Server Concept

After Virtualization:

- Hardware-independence of operating system and applications
- Virtual machines can be provisioned to any system
- Can manage OS and application as a single unit by encapsulating them into virtual machines

Virtual Machines

Virtual machines provide:

- **Hardware independence** – Guest VM sees the same hardware regardless of the host hardware
- **Isolation** – VM's operating system is isolated from the host operating system
- **Encapsulation** – Entire VM encapsulated into a single file

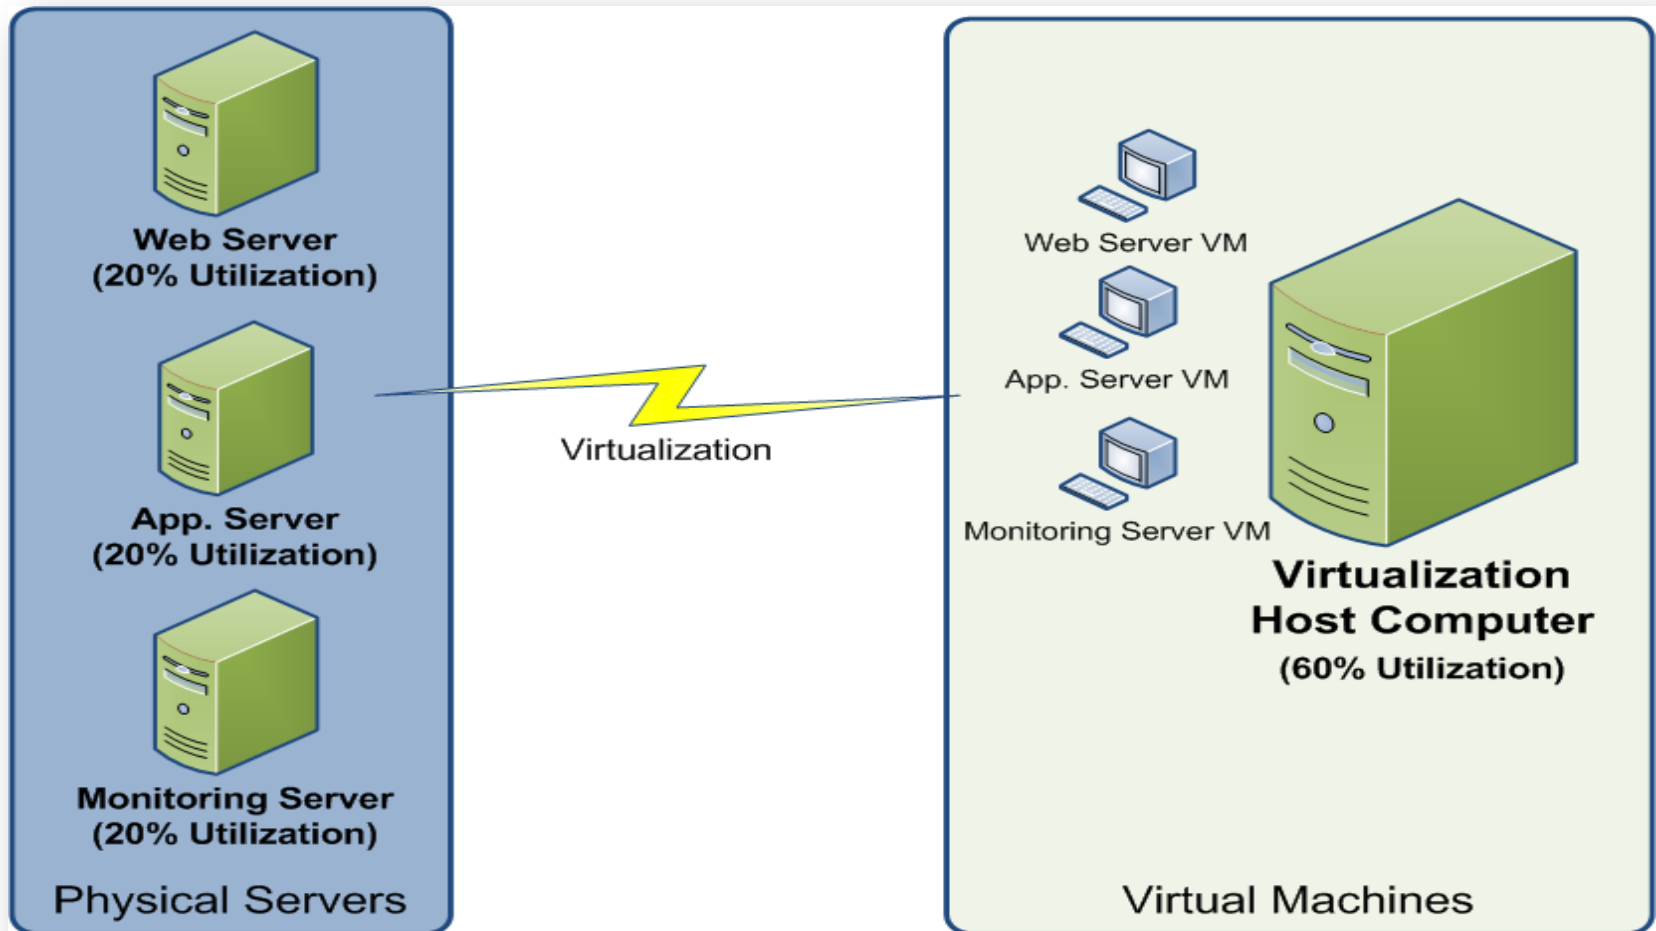

Benefits of Virtualization

- Simplified administration
- Hardware independence/portability
- Increased hardware utilization
- Server consolidation
- Decreased provisioning times
- Improved security
- Software Development
- Testing / Quality Assurance
- Product evaluations / demonstrations
- Training
- Disaster Recovery

Virtualization Features

Virtualization Scenarios

Server Consolidation

Virtualization – Key Solutions / Use Cases

Server Consolidation and Containment – Eliminate server sprawl by deploying systems into virtual machines

Infrastructure Provisioning – Reduce the time for provisioning new infrastructure to minutes with sophisticated automation capabilities.

Business Continuity – Reduce the cost and complexity of business continuity by encapsulating entire systems files that can be replicated and restored onto any target server

Test and Development – Rapidly provision and re-provision test and development servers; store libraries of pre-configured test machines

Enterprise Desktop – Secure unmanaged PCs. Alternatively, provide standardized enterprise desktop environments hosted on servers.

Legacy Application Re-hosting – Migrate legacy operating systems and software applications to virtual machines running on new hardware for better reliability

Top 3 Economic Reasons For Virtualization

1 Reduce Physical Infrastructure Cost

**2 Reduce Datacenter Operating Cost
(e.g. Power & Cooling)**

**3 Minimize Lost Revenue Due to
Downtime**

Virtualization Reduce Energy Consumption

- > Highest consolidation rates on most secure and reliable virtualization platform
- > Safely improve utilization rates
- > **80% energy reduction**

- > Dynamic server and storage migration
- > Power off unneeded servers in real-time
- > Migrate storage dynamically
- > **25% energy reduction**

- > Host desktop PCs in the datacenter
- > Use thin clients, double refresh cycle
- > Reduce storage for similar desktop images
- > **70% energy reduction**

Experienced App Owners Trust Virtualization for Toughest Workloads

What is Available Today

VMware

- VMware released ESX and GSX 1.0 in 2001. Virtual Center released in 2003.
 - Has the most experience
 - Is the farthest along
 - Very mature product suite
 - Focus is on integrating IT process automation around virtualization

Citrix

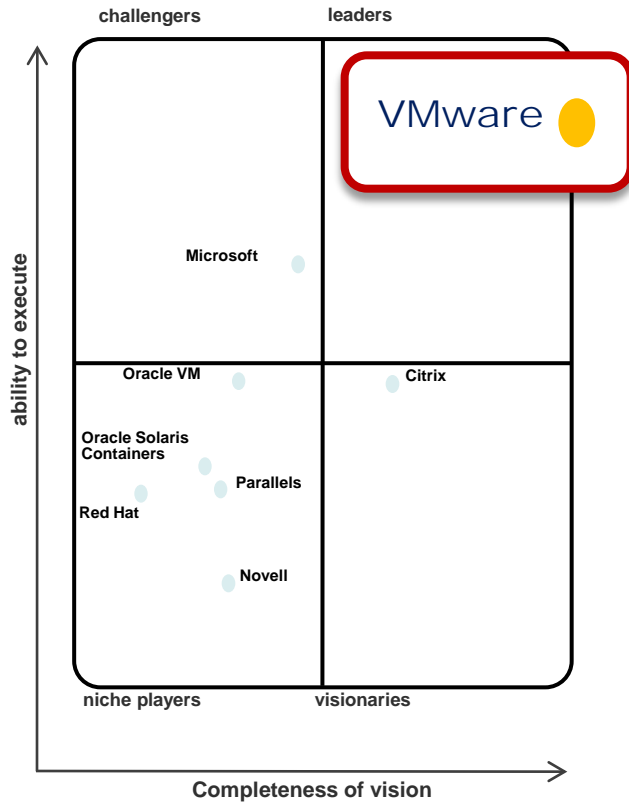

- Citrix XenServer acquired XenSource on August 15th, 2007
 - Has working low cost server virtualization solution
 - Focus is on client virtualization

Microsoft

- Microsoft Hyper-V (formerly 'Windows Server Virtualization')
 - Standalone version released in October 2008
 - Real solution (one with HA) has been out since August 2009.

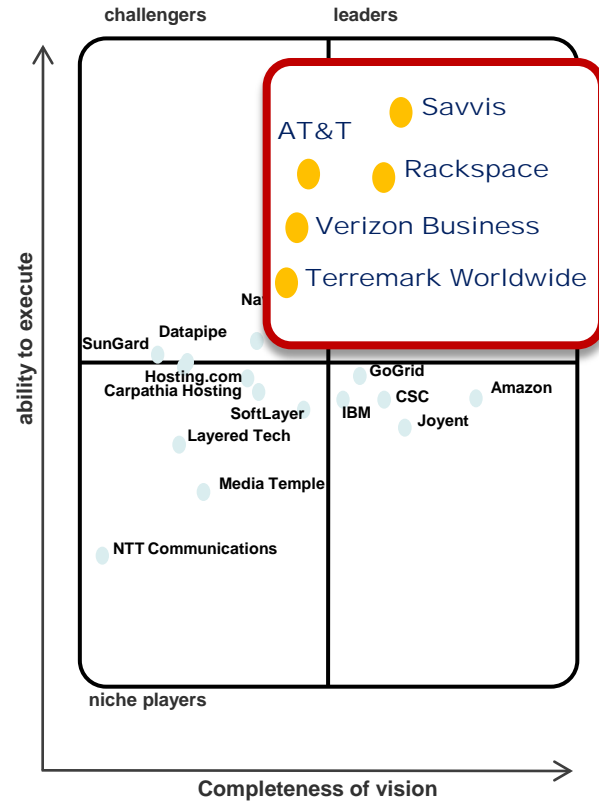

VMware – Recognized as the Virtualization & Cloud Leader (2010)

VMware is only vendor in Leader's Quadrant!

Gartner x86 Virtualization Magic Quadrant

5 of 5 cloud providers in Leader's Quadrant are VMware-based

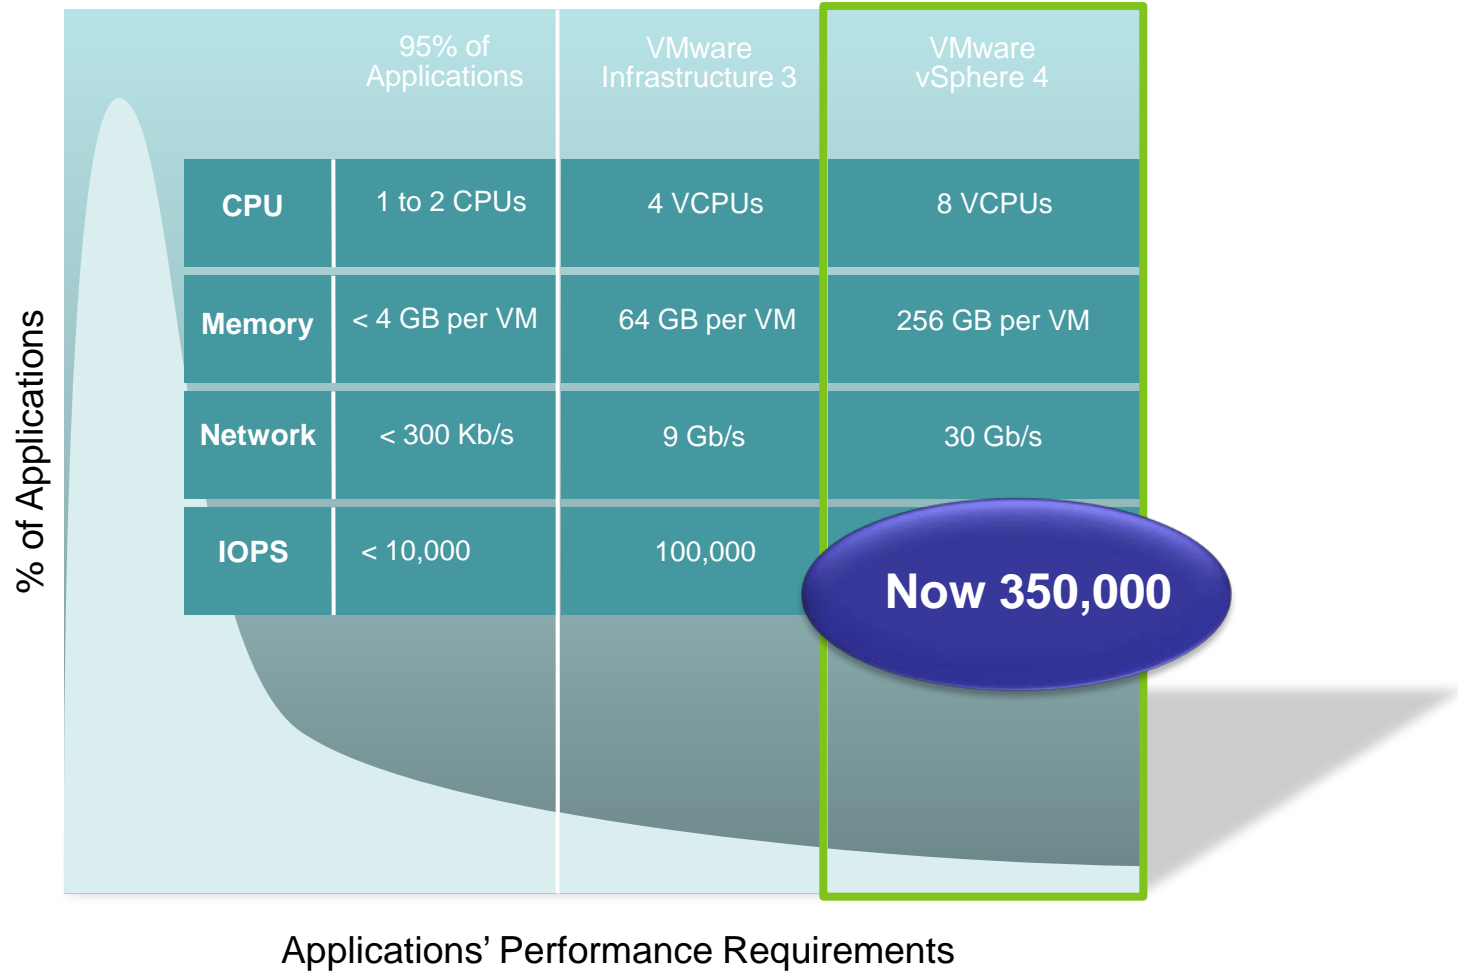

Gartner IaaS Cloud Magic Quadrant (Infrastructure as a Service)

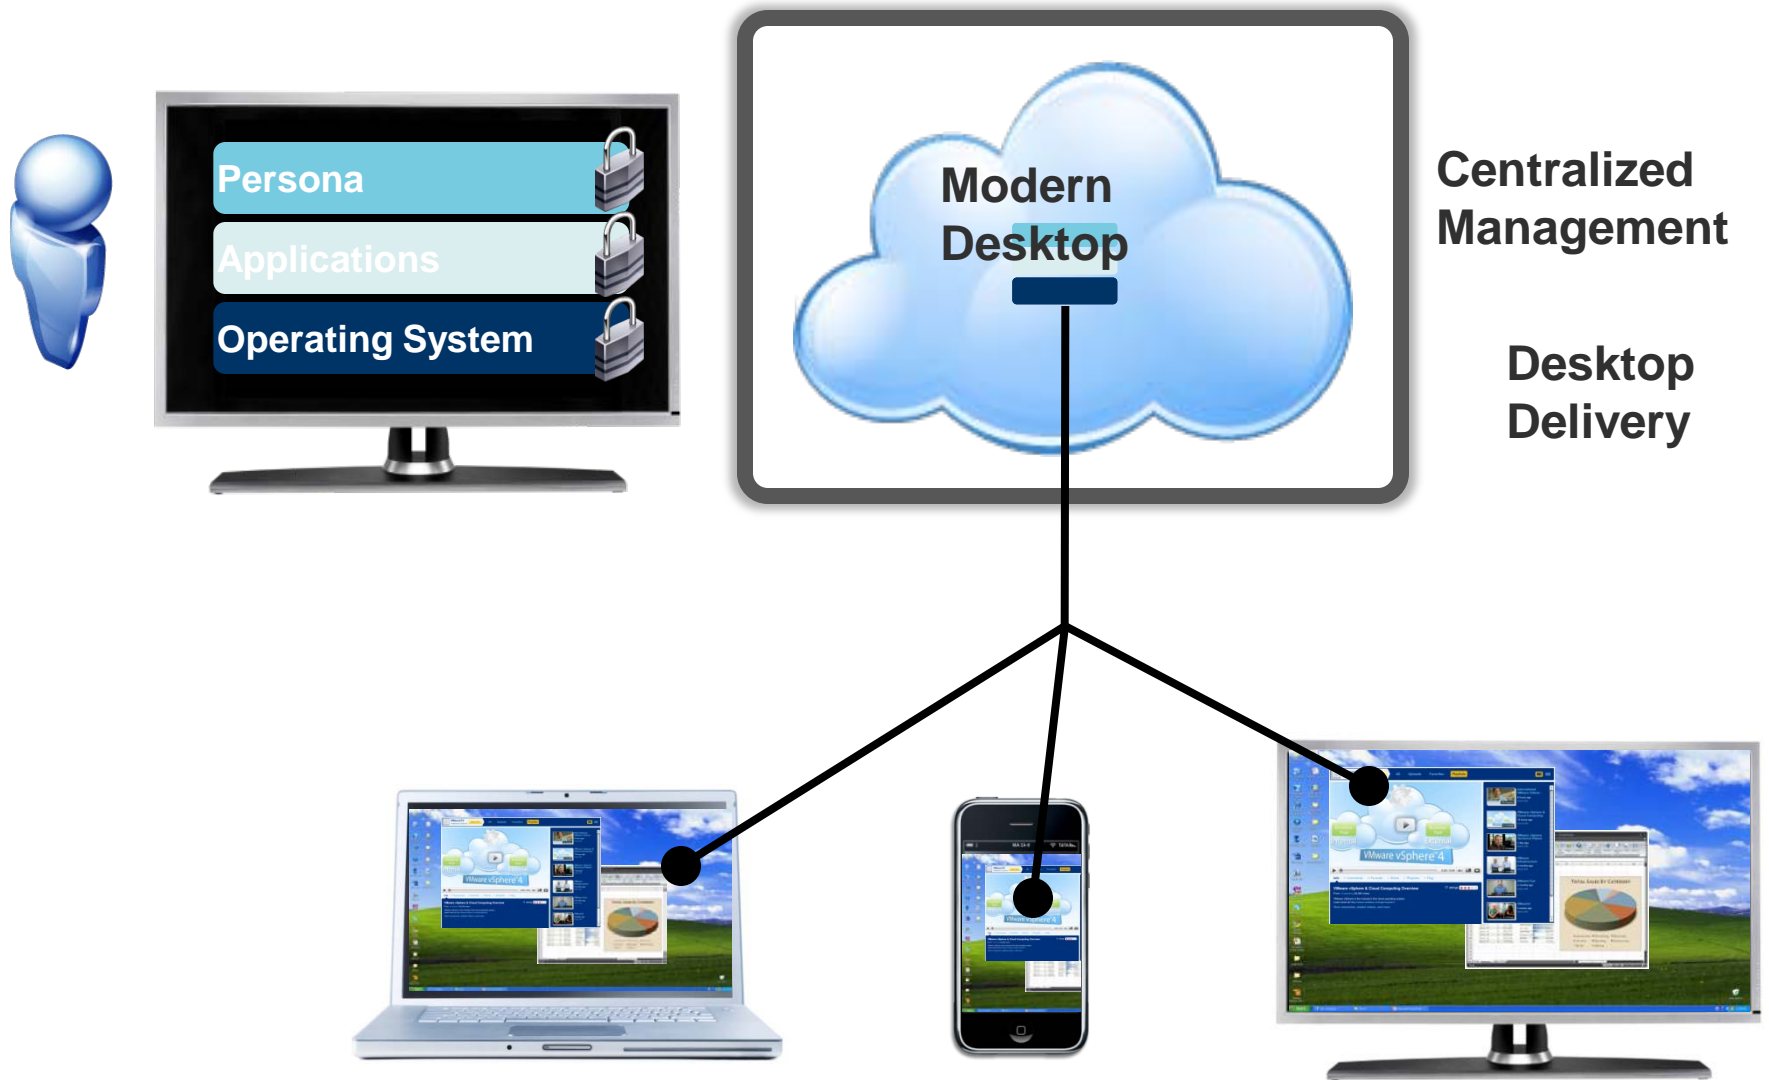

What is Available From VMware

- **VMware's vSphere**
 - Key Features
 - Market Leader
 - Virtualizes 54 Guest OSs
 - Server virtualization solution with HA and load balancing
 - Enhanced vMotion
 - Memory Over commit
 - Transparent Page Sharing
 - Patch Management
 - Fault Tolerance built in
 - Certified on over 450 servers
 - FC, iSCSI, NFS Supported
 - Power Management
 - Distributed switch
 - Supports storage management
 - Storage vmotion

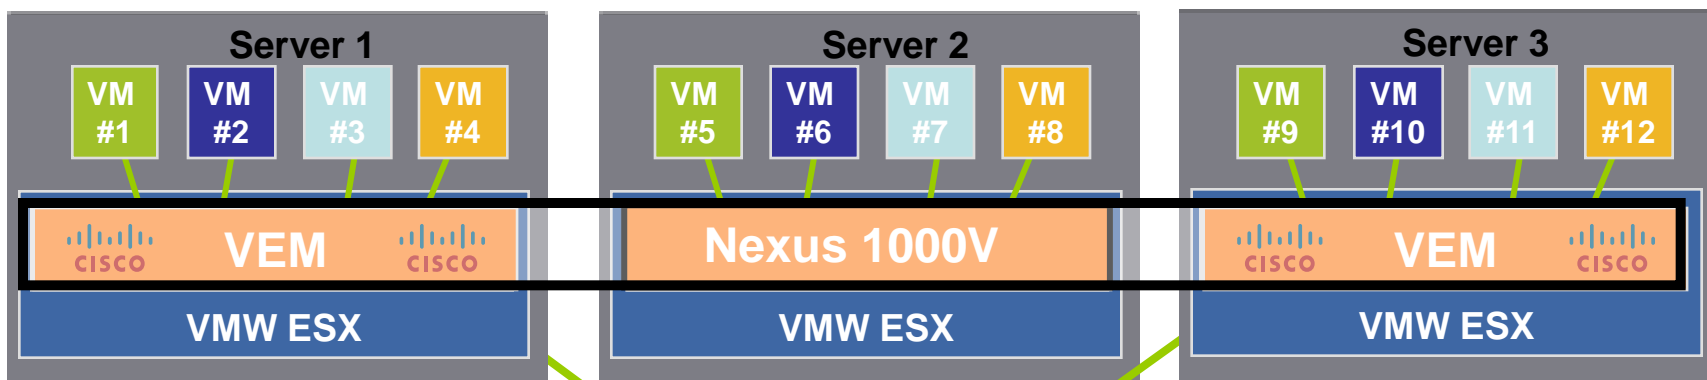

VMware vSphere : Ready to Virtualize All Applications

Modernizing the Desktop – Virtual Desktop Infrastructure

Virtual Distributed Network Switch Cisco Nexus 1000V Architecture

- Virtual Supervisor Module (VSM)**
- Virtual Ethernet Module (VEM)**
- Cisco Nexus 1000V Enables:**
- Policy Based VM Connectivity
 - Mobility of Network & Security Properties
 - Non-Disruptive Operational Model

The Disadvantages of Virtualization

- Virtualization may not work well for:
 - Resource-intensive applications
 - VMs may have RAM/CPU/SMP limitations
 - Performance testing
 - Hardware compatibility testing
 - Specific hardware requirements
 - Custom hardware devices
- Some hardware architectures or features are impossible to *virtualize*
 - Certain registers or state not exposed
 - Unusual devices and device control
 - Clocks, time, and real-time behavior

System Virtualization - Present State

- Data center and desktop computing successfully use virtualization to
 - Better utilize computing capacity
 - Balance computing load
 - Manage complexity and parallelism
 - Improve security by isolation
- Mobile and embedded computing currently lag behind since
 - Most hypervisors only support the x86 platform
 - Most hypervisors require large memories
 - Most hypervisors have poor real-time support
 - Most hypervisors are inefficient with microkernel OSs
 - Full-virtualization is not available. Operating system source code needs to be available and must be modified
 - Suitable open source-code hypervisors are not available

Cloud Computing Takes Virtualization to the Next Step

- **You don't have to own the hardware & the staff**
- You “rent” VMs & services as needed from a ITaaS provider (IT as a Service)
- There are multiple public cloud providers
 - e.g. Amazon EC2 and many others
(Verizon, iLand, Rackspace, Savvis, HP, IBM)
- The Cloud will provide IT similar to public utilities providing electricity, gas, and water

Private, Hybrid and Public Clouds
